

Aim: Understanding database operations and implementing a GUI in Python.

In today's lab, you will integrate a Python Tkinter-based GUI with a MySQL database. The GUI will allow users to insert and list student records.

You can use lecture slides (Week 12 & Week 13) for a starting point.

- 1) Before starting the Python code, you need a database and a table to store student information. Therefore, install MySQL Connector Python, establish connection and create a database, call it "StudentDatabase".
- 2) Now, create a table called "Students", with attributes: Let user prompt the name and score, you can implement ID as an auto increment variable. Make sure to insert the student to the table.
 - a. ID (int, also primary key)
 - b. Name (string)
 - c. Score (int)
- 3) Start implementing your GUI and display the student table.
- 4) Create a textfield and a button in your GUI, in your textfield, enter a score between 1 and 100, and after clicking the button, fetch the students which has the score higher than that score in your textfield.
- 5) Finally, display your updated GUI.

NOTE: In this lab, you are not expected to submit or send your codes to me, meaning you will not lose or gain any credits from it.
